

Using our expertise in telematics, data processing and software development, IRIS has the capability to solve the problem of unifying fragmented hardware deployments and improving poorly functioning data processing and reporting systems.

Comms Hub

There are almost limitless choices for telematics hardware, some manufactured by IRIS and plenty freely available from the Far East. The missing element however is the middleware to bring far deeper functionality to these devices.

- ↪ Get highly functional telematics outputs from fragmented hardware deployments with differing technical capabilities
- ↪ Comms Hub is hardware agnostic, meaning you to get consistent, highly adaptable outputs
- ↪ It adheres to an industry standard open architecture
- ↪ Achieve integration of Fleet, Asset and Mobile Workforce tracking into other systems

Comms Hub is our proprietary software platform and has web-hooks at its heart. This means a single event trigger could result in multiple communications actions, all in an instant and defined by you.

Mobile Apps

Sometimes you can avoid the need to invest in hardware and installation by using technologies already in the hands of your workforce. By using a combination of our Mobile Application development expertise and Comms Hub, we can provide rapid, low-cost tracking solutions that:

- ↪ Require little up-front investment
- ↪ Have no need for physical installation
- ↪ Adhere to Industry standard open architecture
- ↪ Can be up and running in a matter of hours

Our Mobile Application expertise also means we can deliver an end to end solution if hardware, middleware and user interface is required.

Please see our contact details below.
We would be delighted to hear from you.
